RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05
The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at
test separation distances ≤ 50 mm are determined by:
[(max. power of channel, including tune-up tolerance, mW)/(min. test
separation distance, mm)] ・[√f(GHz)] ≤ 3.0 for 1-g SAR and ≤ 7.5 for
10-g extremity SAR, where
・ f(GHz) is the RF channel transmit frequency in GHz
・ Power and distance are rounded to the nearest mW and mm before
calculation
・ The result is rounded to one decimal place for comparison

Worse case is as below: [2402MHz -2.13dBm（0.612 mW） output power]

(0.612mW /5mm) ・[√2.402(GHz)]= 0.2 <3.0 for 1-g SAR

Then SAR evaluation is not required
